Method 1: log()

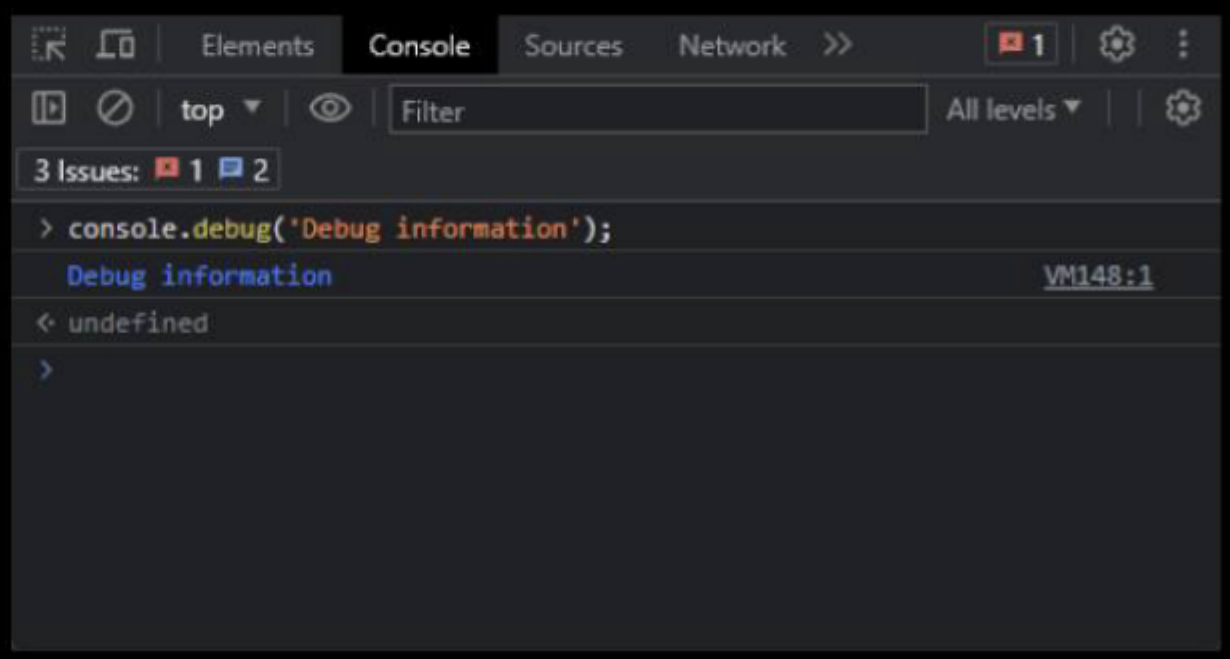
The log() method is the most commonly used method in the console object. It allows you to log messages to the console for debugging purposes. You can pass one or more arguments to log() to display multiple values in a single log statement.

```
console.log('Hello, world!');
console.log('The answer is:', 42);
```

Method 2: debug()

The debug() method is used to log debug information to the console. It is similar to log(), but it is specifically intended for debugging purposes. It can help you print detailed information about variables, objects, or specific points in your code.

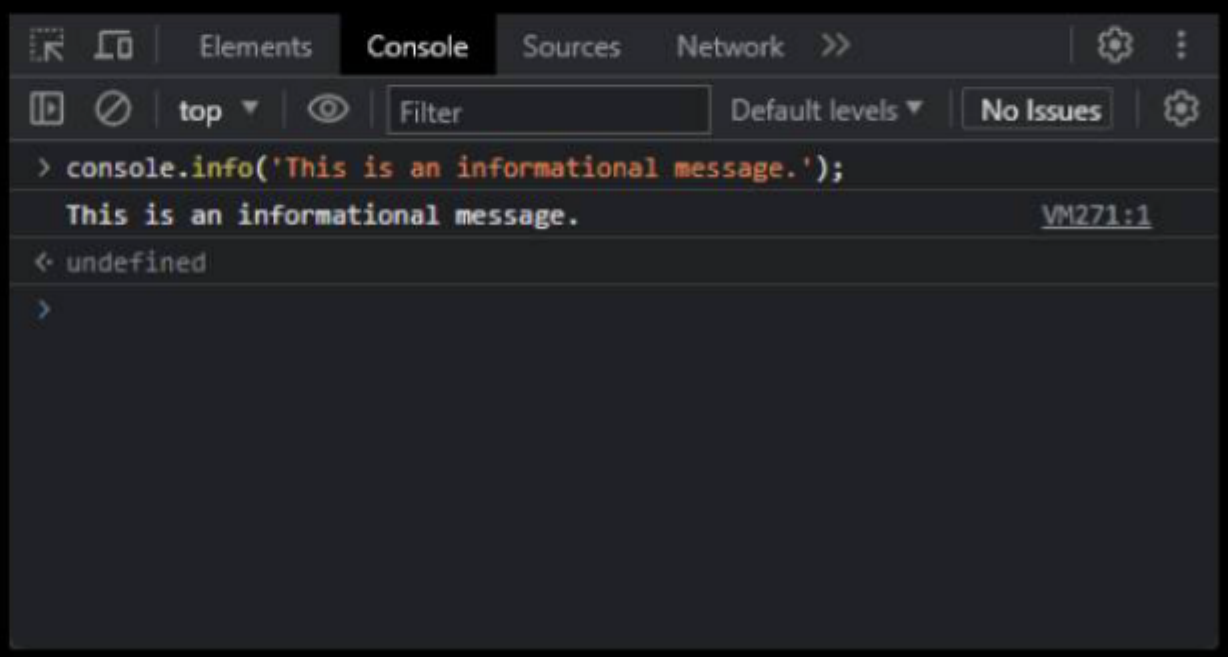
```
console.debug('Debug information');
```



Method 3: info()

The info() method is used to display informational messages in the console. It is similar to log(), but it provides additional visual cues to differentiate the output as an informative message.

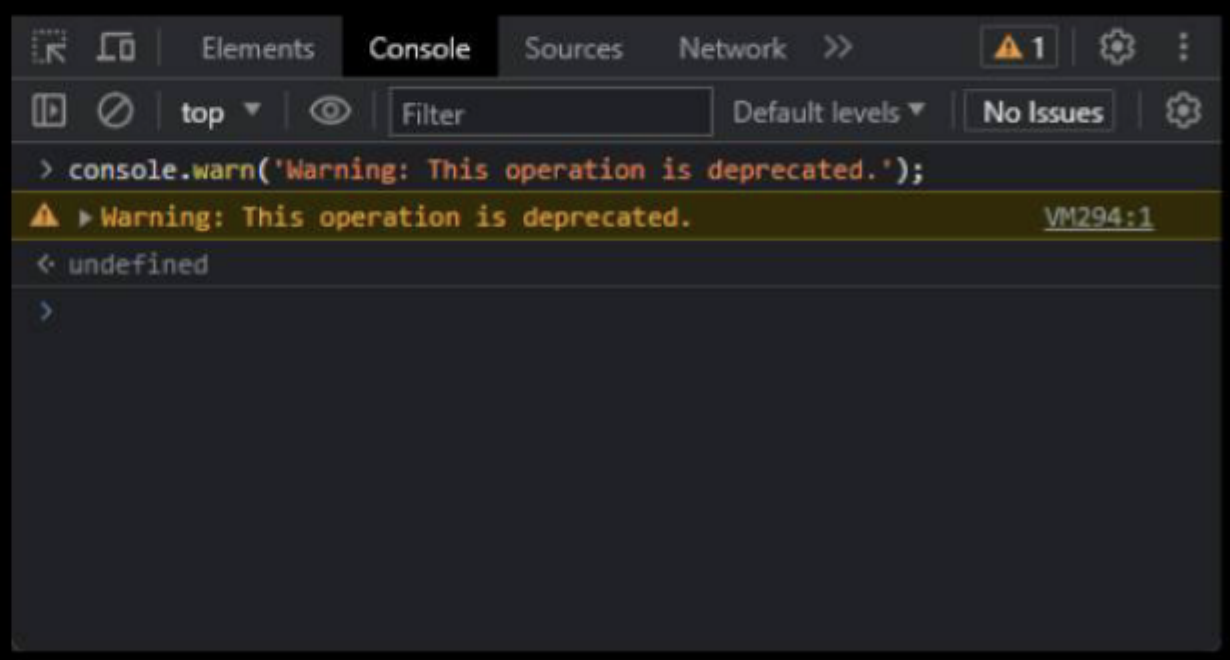
```
console.info('This is an informational message.');
```



Method 4: warn()

The warn() method is used to display warning messages in the console. It highlights the output with a warning icon, making it easy to identify potential issues or areas that require attention.

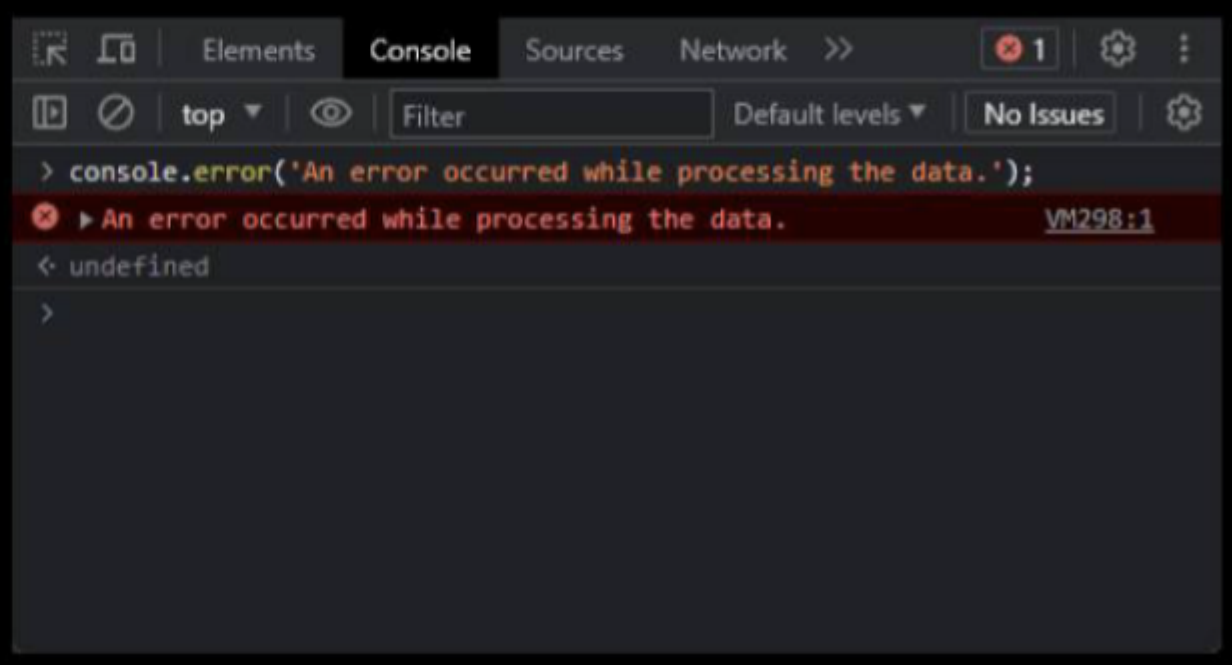
```
console.warn('Warning: This operation is deprecated.');
```



Method 5: error()

The error() method is used to display error messages in the console. It marks the output with an error icon and often includes a stack trace, allowing you to track down and fix errors in your code.+

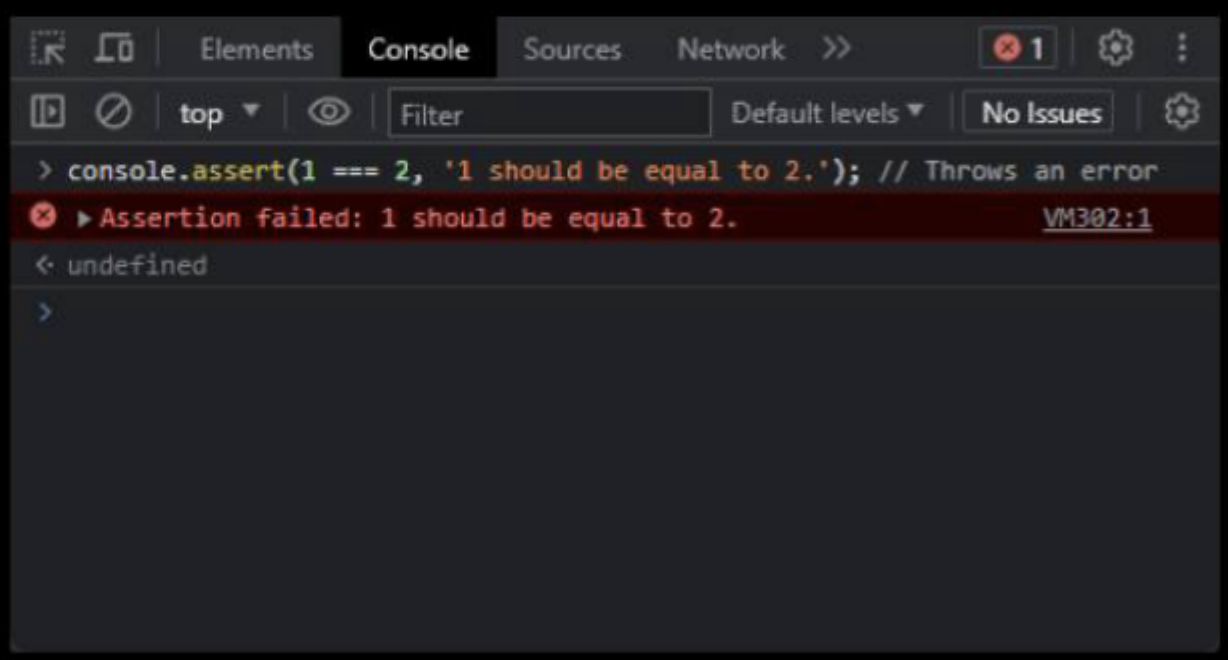
```
console.error('An error occurred while processing the data.');
```



Method 6: assert()

The assert() method is used to assert that a condition is true. If the condition is false, it will throw an error and display an error message in the console.

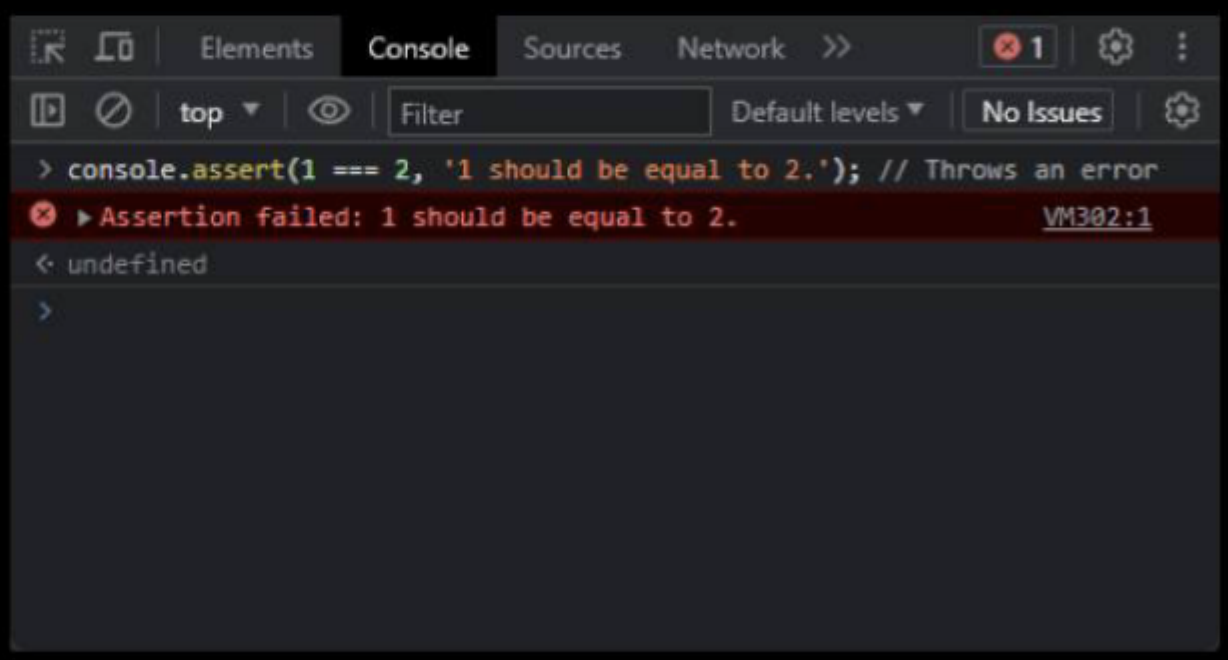
```
console.assert(1 === 2, '1 should be equal to 2.');
```



Method 7: clear()

The clear() method is used to clear the console, removing all previously logged messages. It provides a clean slate for debugging or logging new information.

```
console.clear();
```



Method 8: count()

Method 9: countReset()

Method 10: group()

Method 11: time()

Method 12: timeEnd()

Method 13: timeLog()

Method 14: table()

Method 15: trace()

Method 16: dir()

Method 17: dirxml()

Method 18: groupCollapsed()

Method 19: groupEnd()

Method 20: profile()

Method 21: profileEnd()
